

# Aerosol Optical Depth, Calibration and Determination.

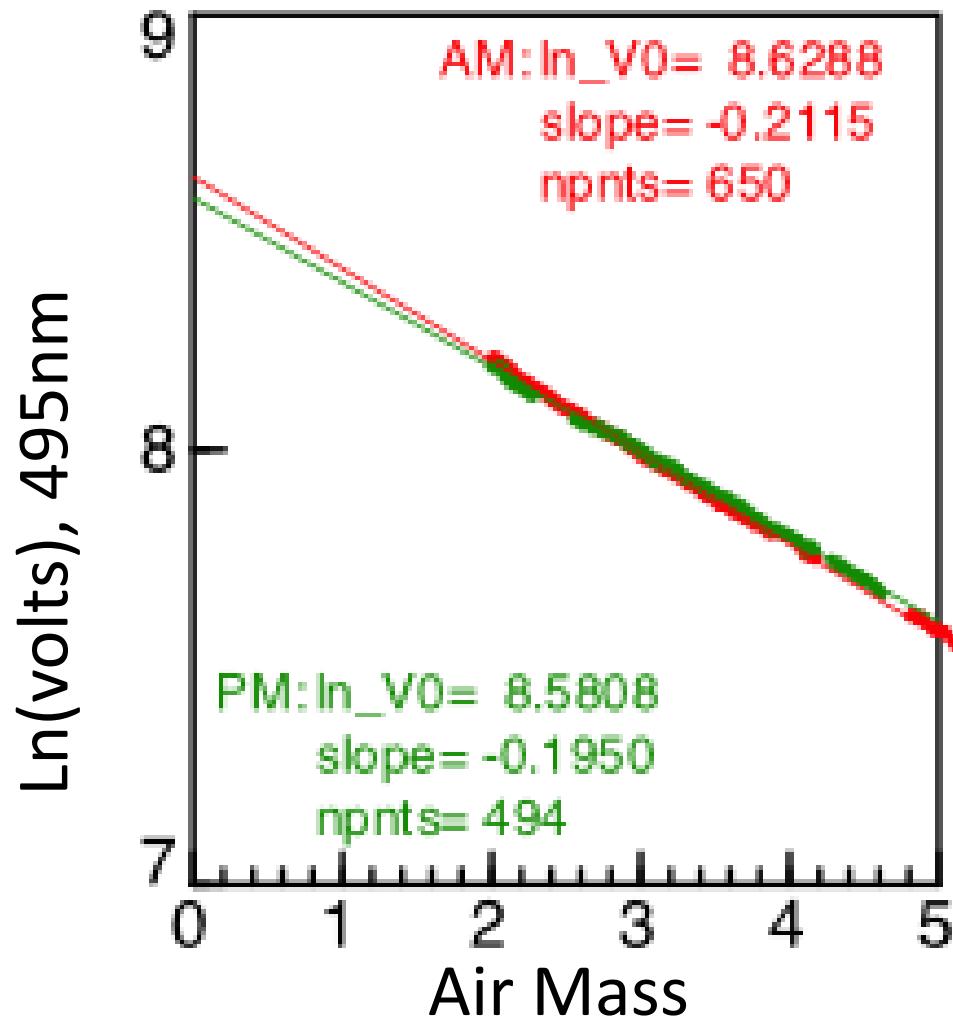

Can V0s be determined in place?

Fred Denn, Bryan Fabbri (Science Systems and Applications, Inc. (SSAI), Hampton, VA). Greg Schuster (NASA Langley Research Center, Science Directorate, Hampton, VA)

This analysis was preformed using data from a Yankee Environmental Systems MultiFilter Rotating Shadowband Radiometer (MFRSR). It is one of the later units (#550) for which the temperature dependence was, presumably, solved. Data was collected At NASA Langley; Davos, CH; Mauna Loa, Hawaii; and Golden, Colorado.

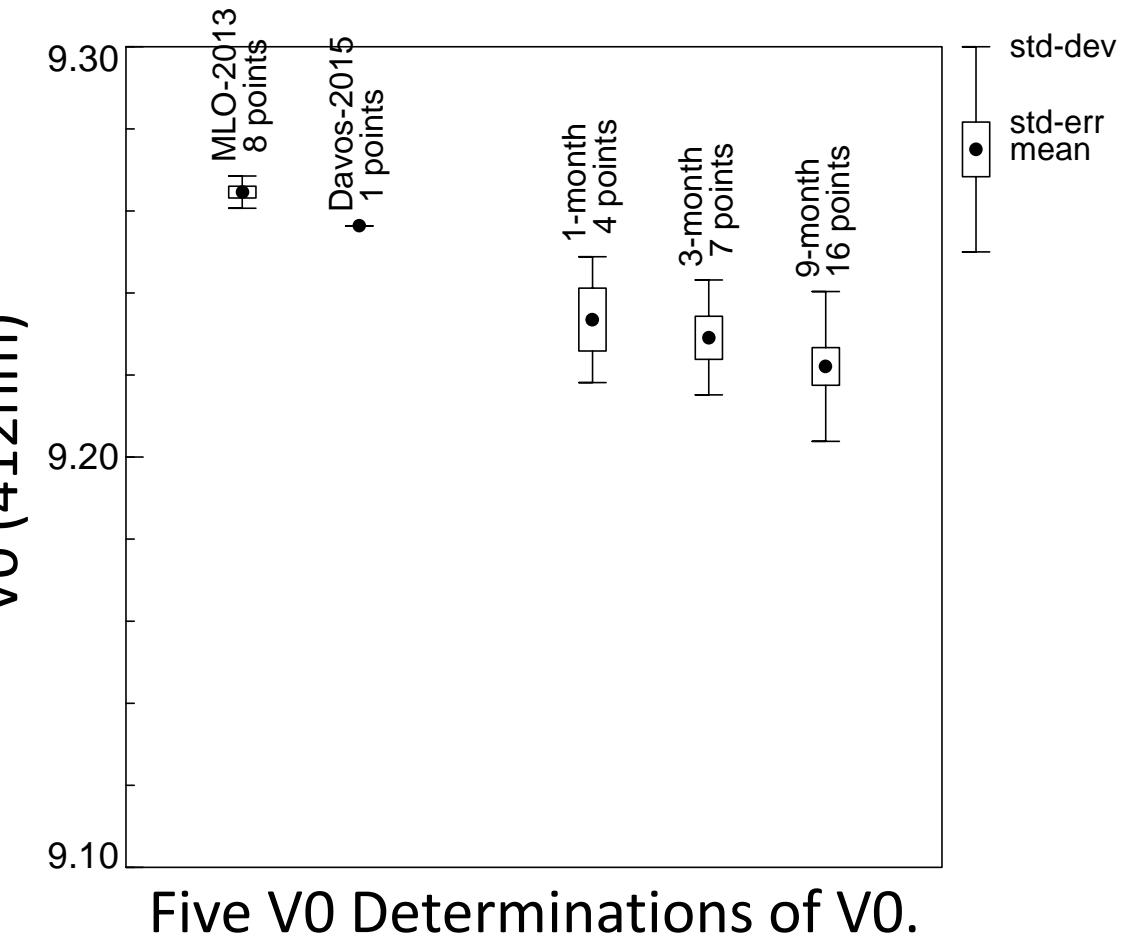

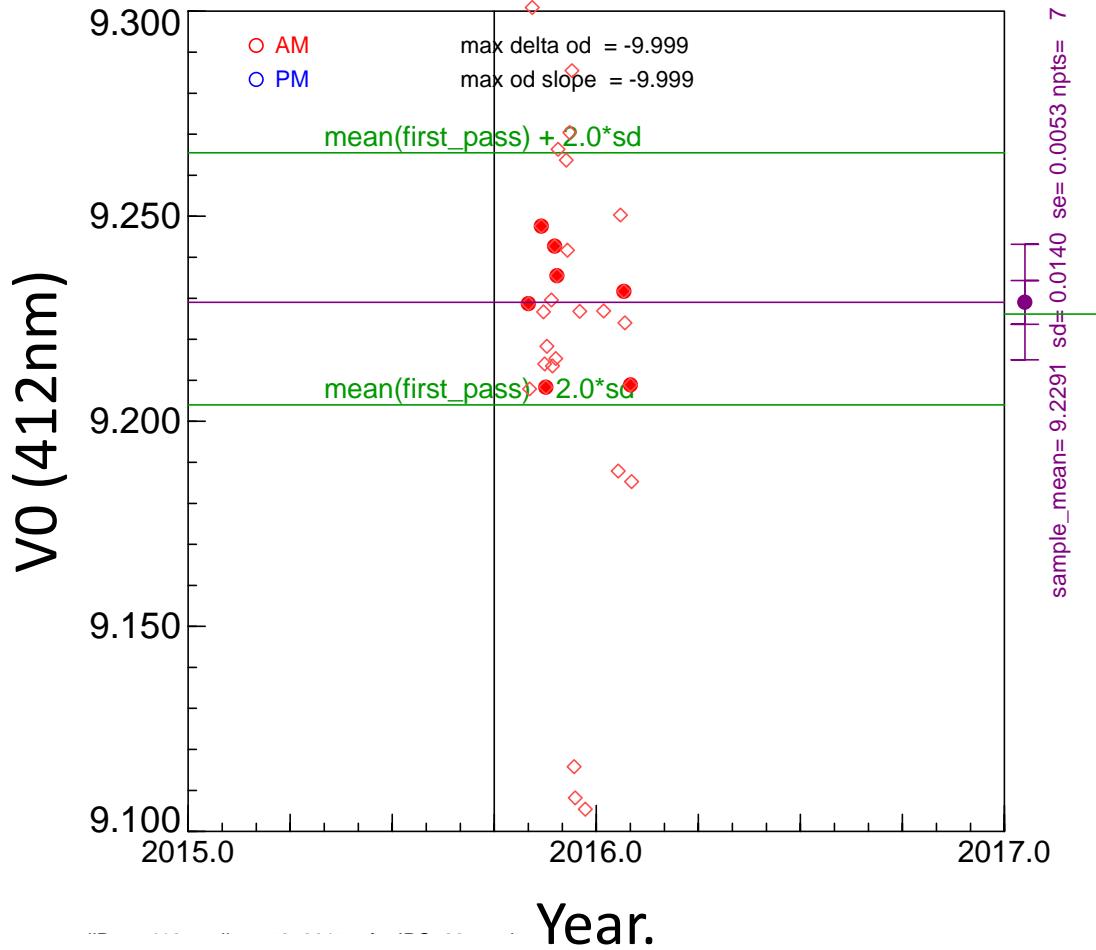

# An Example of the Determination of V<sub>0</sub>.

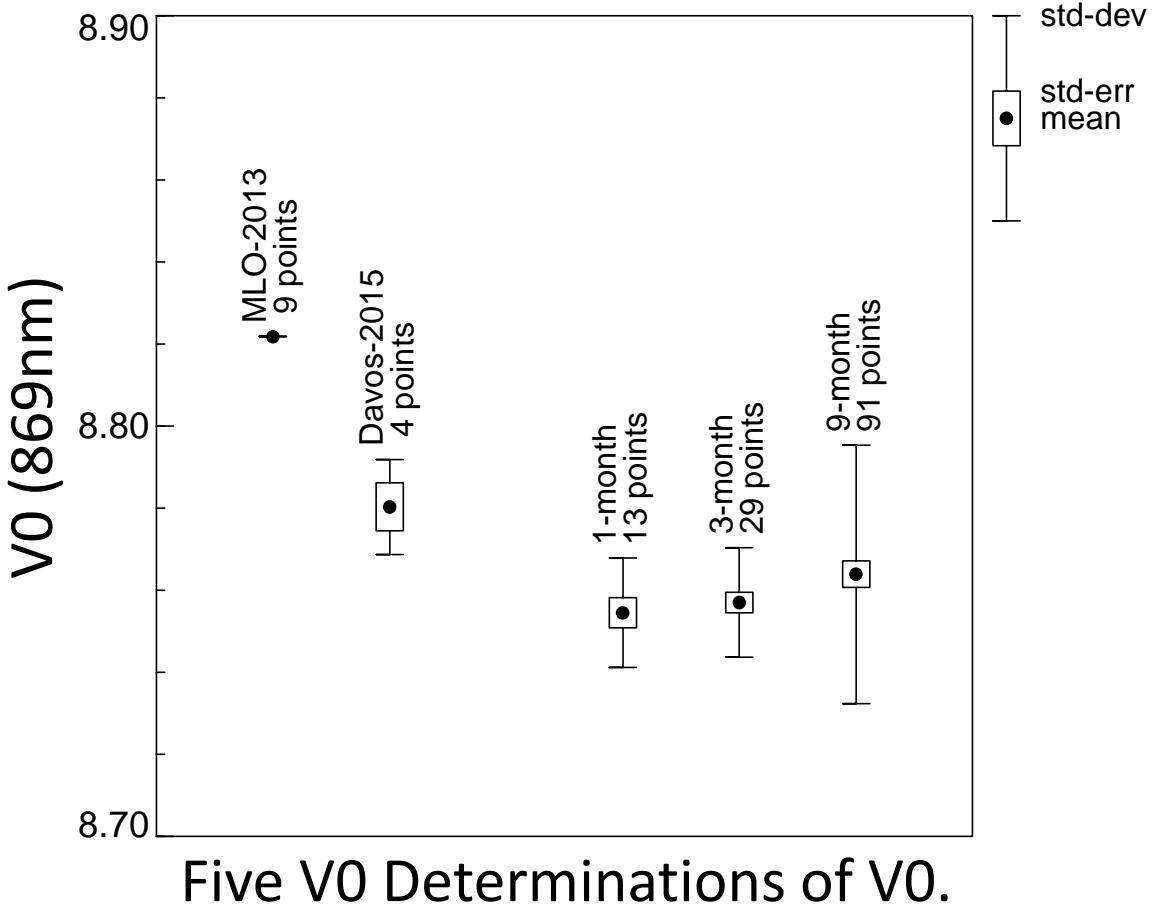

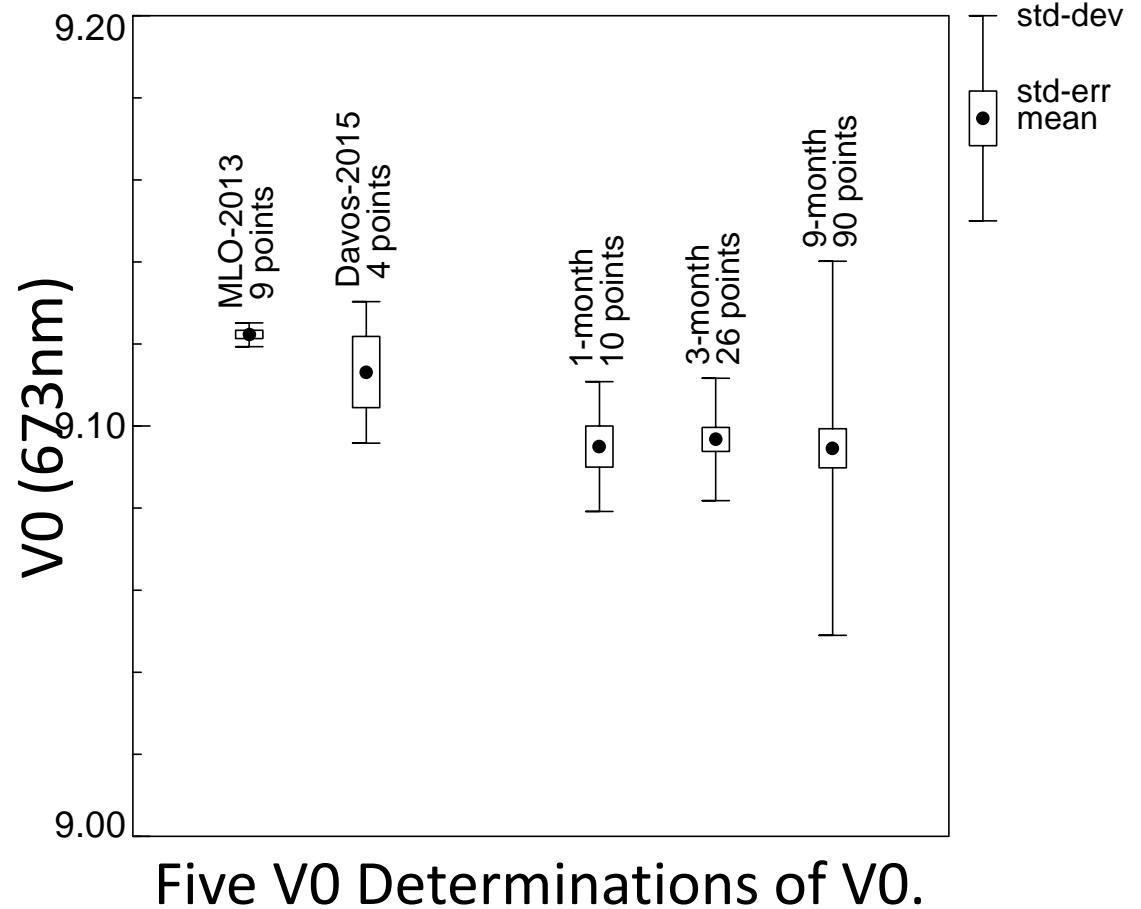

# Determination of Mean V0s (Five Methods)

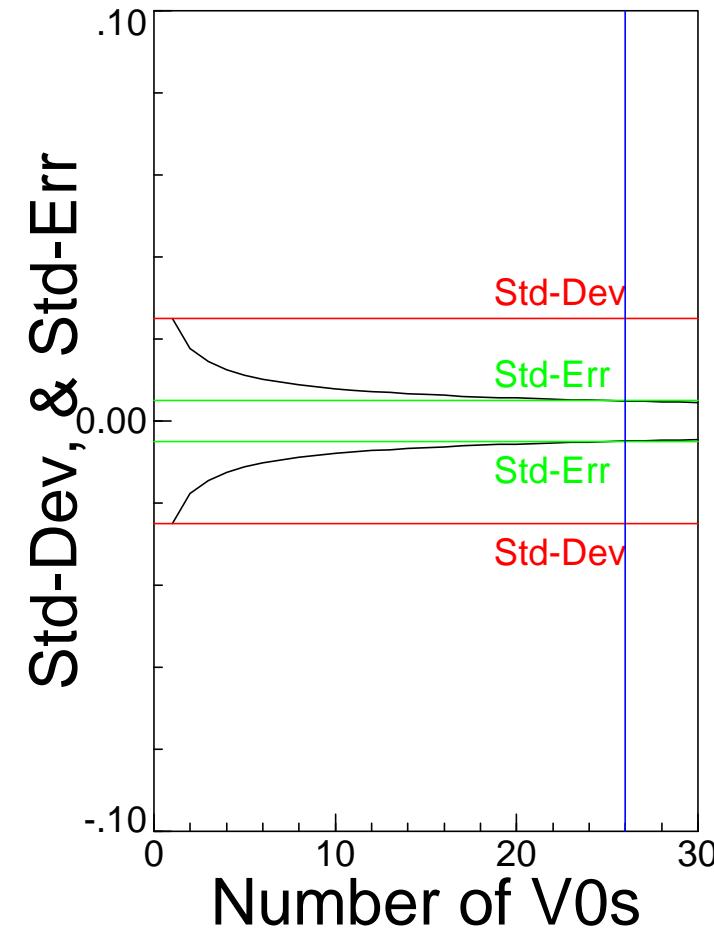

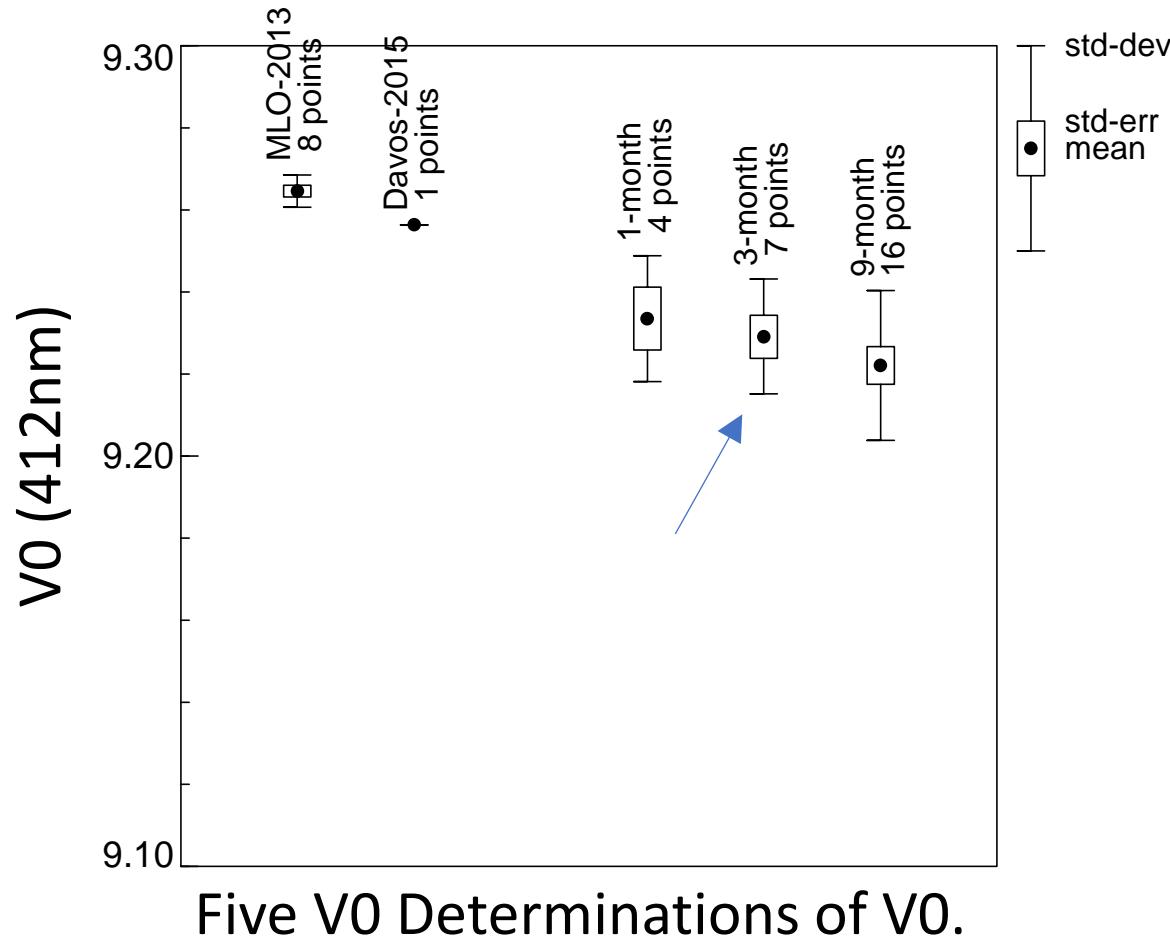

## Three Months of V0s.

# Determination of Mean V0s (Five Methods)

# Relationship between Standard Deviation and Standard Error for a Typical 3 Month Mean V0 as the Number of V0 increases.

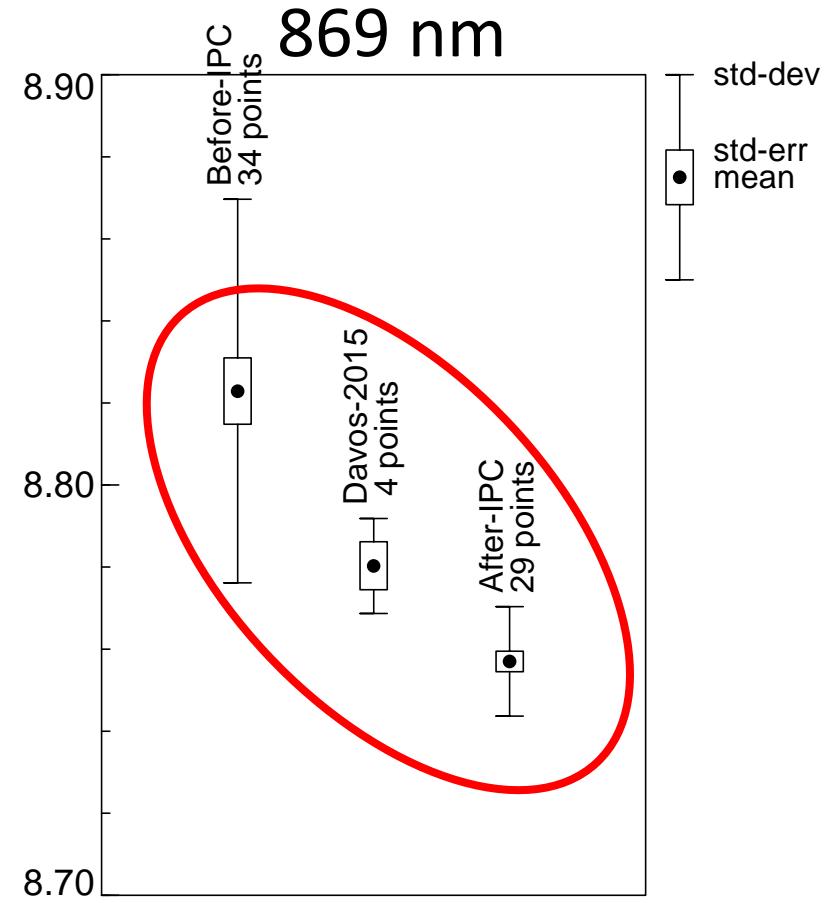

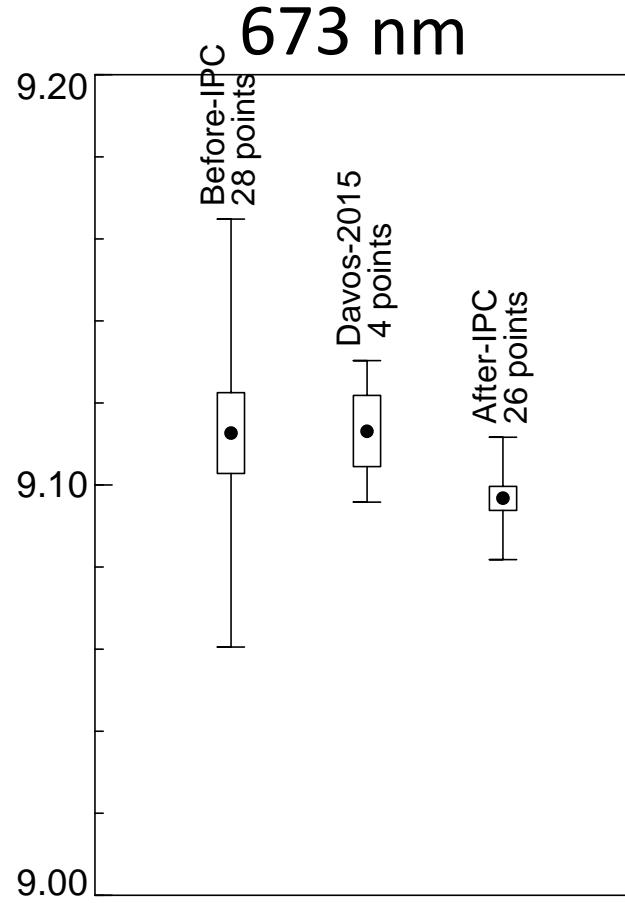

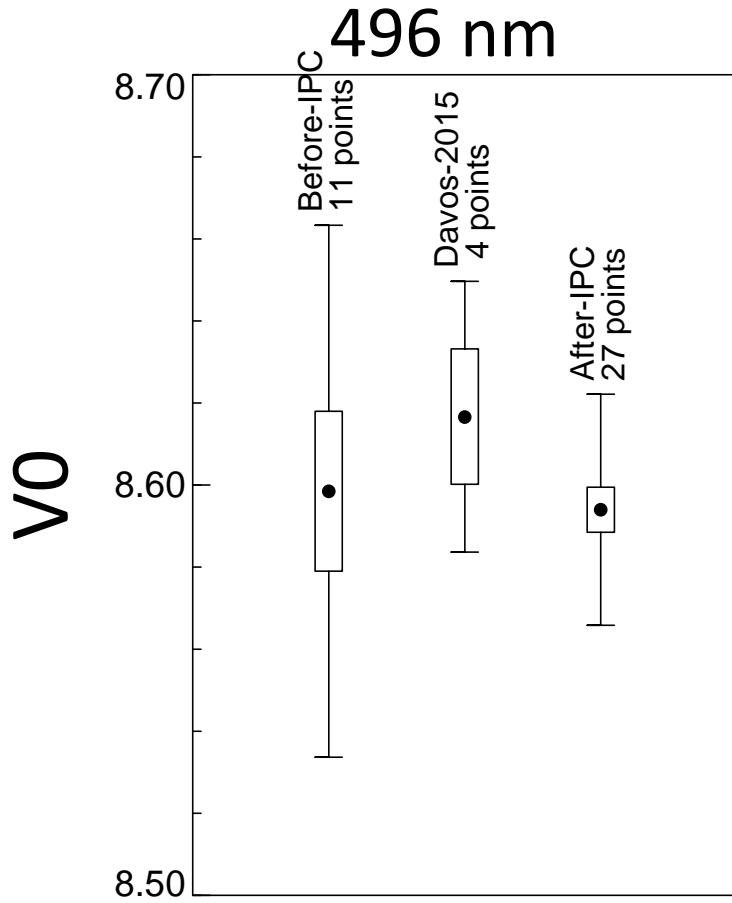

## Some other Issues.

- 1) Shipping, damage.
- 2) Temperature dependence unknown.
- 3) Lost data while calibrating.

# Shipping can introduce changes to an instrument

## Here the 869 nm channel changed during shipping.

# An example of a two year linear fit to V0 points.

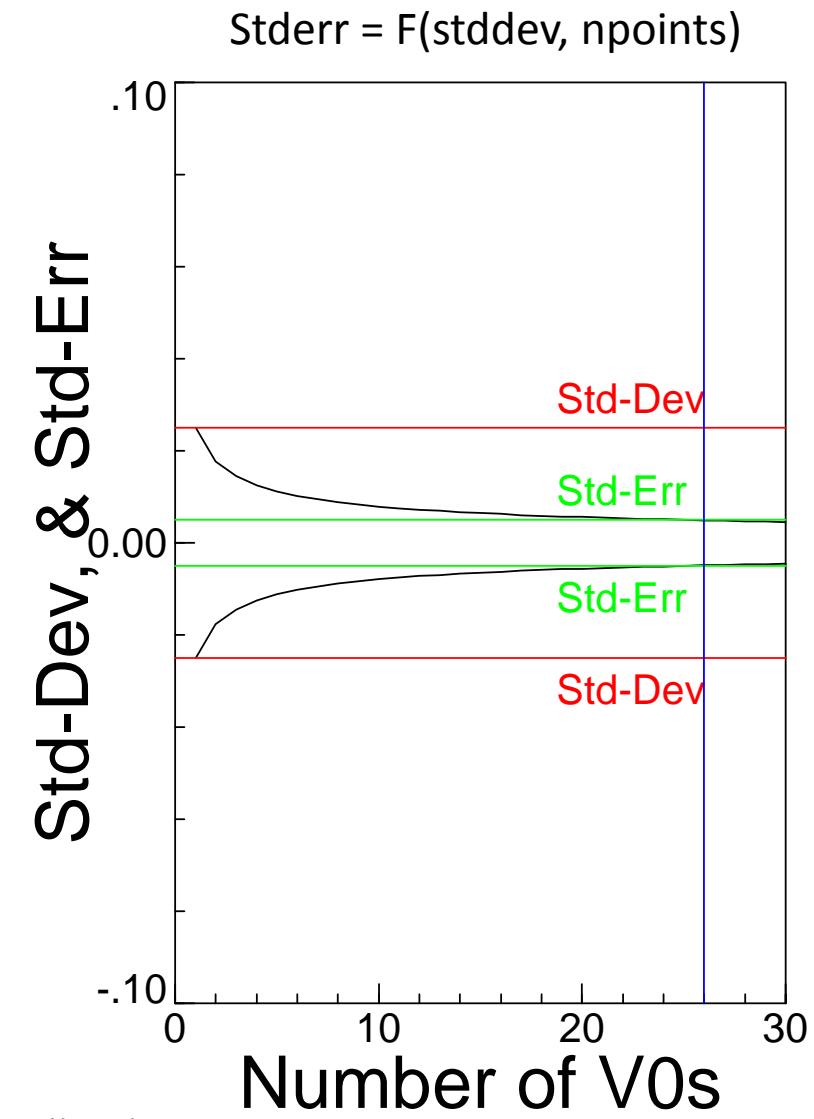

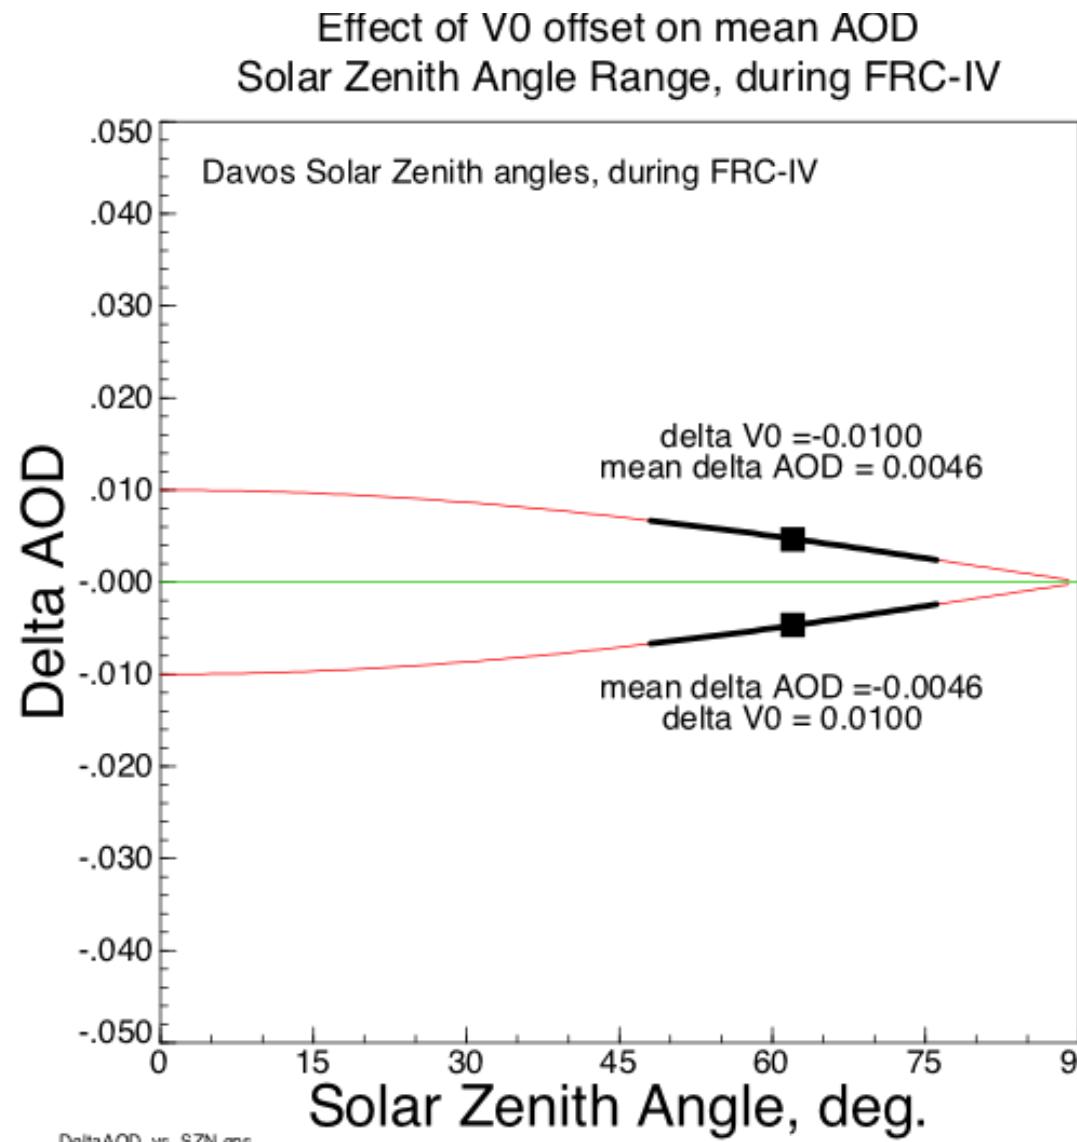

An interval this long introduces errors.

Also a slow decline in the can be seen here.

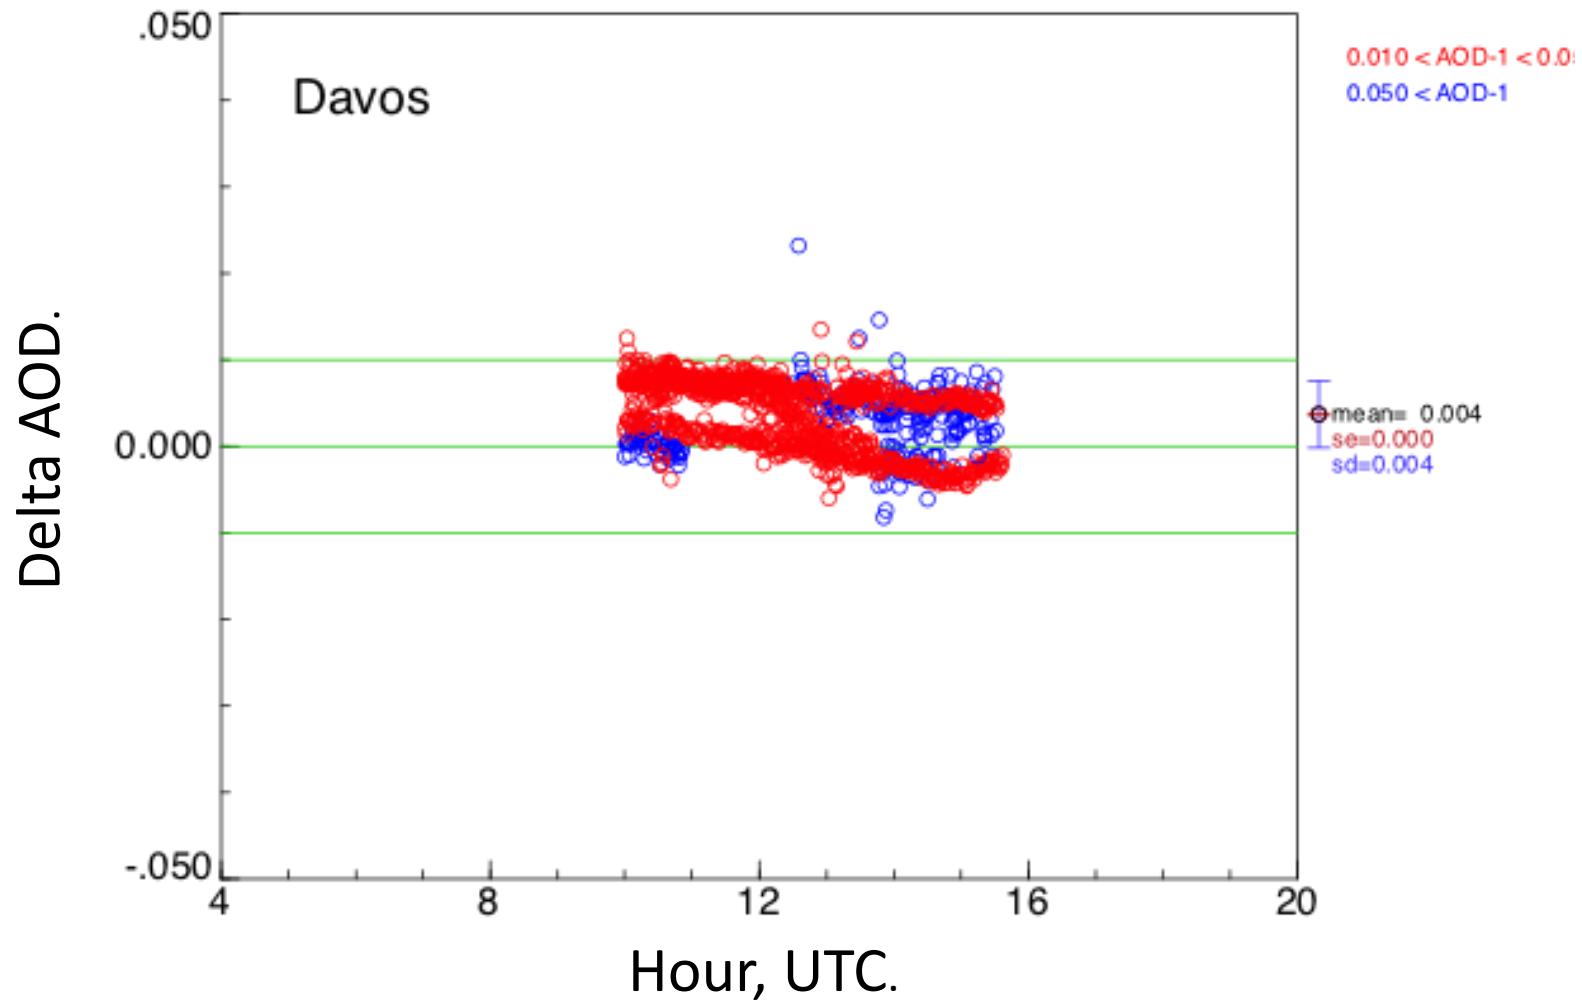

# Effect of a change in V0 on resulting AOD Measurements.

Here during the Filter Radiometer Comparison held during IPC-2015.

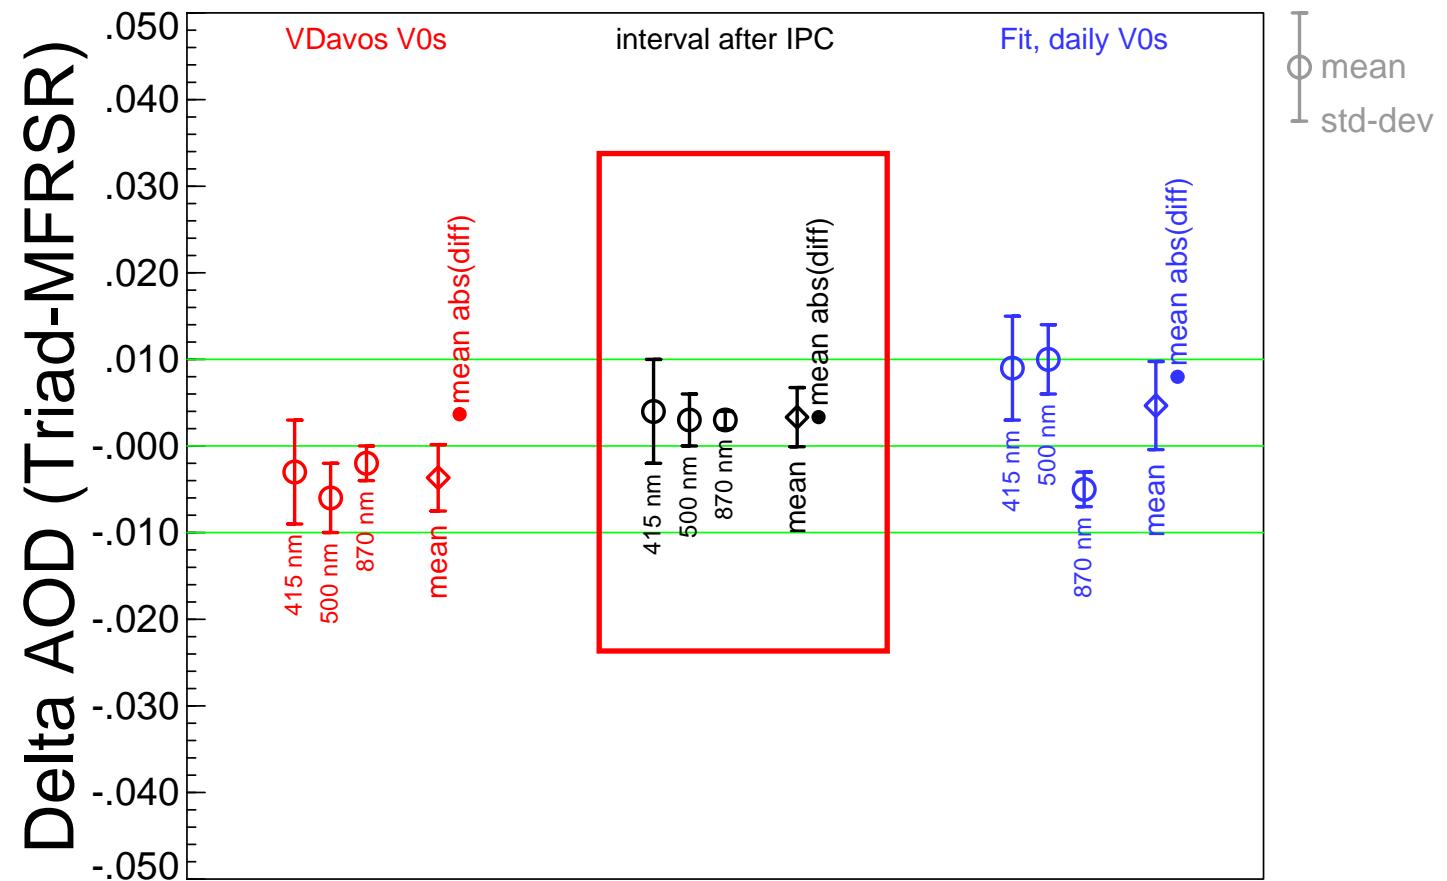

# AOD differences Davos PFR Triad minus MFRSR. MFRSR V0s based on three months after IPC.

# AOD Differences PMOD-PFR-Triad - MFRSR-550

Data Taken in Davos during FRC-III Sept-Oct 2015

0.04 < AOD < 1.0 (2017-12-21 values)

Can V0s be determined in place?
